TRUCK INVENTORY AND USE SURVEY

North Dakota

The publications from the 1982 Economic and Agriculture Censuses are dedicated to the memory of Shirley Kallek, Associate Director for Economic Fields. During her career at the Bureau of the Census (1955 to 1983), she continually directed efforts to improve the timeliness and accuracy of economic statistics.

ECONOMIC SURVEYS DIVISION W. Joel Richardson. Chief

ACKNOWLEDGMENTS—Many persons participated in the various activities of the 1982 Census of Transportation. Primary direction of the program was performed by Shirley Kallek, Associate Director for Economic Fields (until May 1983), Charles A. Waite, her successor, and Michael G. Farrell, Assistant Director for Economic and Agriculture Censuses (until August 1984), and John H. Berry, his successor.

This report was prepared in the Economic Surveys Division under the general direction of **W. Joel Richardson**, Chief. **Robert E. Crowther**, Assistant Chief for Census Programs, was responsible for the overall management of the census of transportation. He guided the planning and implementation of the project and coordinated activities with other divisions.

Carmen Campbell, Transportation Branch, assisted by Troy King, Geroid L. Morning, Joseph K. Tintera, Tempie Whittington, and Georgeann H. Wright, was directly responsible for the planning, development of specifications and procedures, analysis of data, and preparation of this report.

The computer processing systems were developed and coordinated under the direction of Andrew L. Grieco, Assistant Chief for Methods and Systems. Charles A. Venters, Chief, Economic Programming Branch, and Paul E. Poissant, Chief, Directory and Census Programming Branch, were responsible for implementation of the computer systems, and the computer programs were prepared under the supervision of Arnold L. Braddock and Chuck Fee Lee, assisted by Ernestine Kornegay, Avis W. Buchanan, and Carrie Lee Johnson.

The mathematical techniques and quality control requirements were developed by Mitchell L. Trager, Assistant Chief for Research and Methodology, assisted by Kenneth R. Sausman, Thomas O. Cevis, Nancy H. Dunn, Robert A. Peregoy, and Edwin L. Robison.

Other persons made important contributions in such areas as developing specifications, procedures, and resolving problems. They include Alfred R. Brand, Helen L. Barton, Ellen Kummer, Leonard Tauber, and Mark Grice.

Planning, design, review, and composition of report forms were performed in the Administrative Services Division, Robert L. Kirkland, Chief.

Publication planning, design, editorial review, composition, and printing procurement were performed in the Publications Services Division, Raymond J. Koski, Chief.

Mailout preparation and receipt operations, clerical and analytical review activities, data keying, and geocoding review were performed in the Data Preparation Division, **Don L. Adams**, Chief.

Computer processing was performed in the Computer Services Division, C. Thomas DiNenna, Chief (until February 1984), and John E. Halterman, his successor.

Photocomposition programs for the statistical tables were developed in the Systems Support Division, Larry J. Patin, Chief (until October 1983), and Arnold E. Levin, his successor.

The overall planning and review of the census operations were performed by the staff of the office of the Assistant Director for Economic and Agriculture Censuses.

Special acknowledgment is also due the many businesses whose cooperation has contributed to the publication of these data.

ECONOMIC CENSUSES OVER TIME

The early beginnings of America's industrial output were first measured in the United States in the 1810 Decennial Census and again in 1820, when questions on manufacturing were included with those for population. Beginning with the 1840 Decennial Census, there were enumerations of manufactures and mineral industries at 10-year intervals up to and including the year 1900 for manufactures and 1940 for mineral industries. The latter census was taken again for 1954, 1958, 1963, and 1967.

Because of the increasing dominance of manufacturing in the early 20th century, Congress directed that quinquennial censuses of manufactures be taken beginning in 1905. However, from 1919 through 1939, these censuses were conducted every 2 years. The need for war-related current surveys in the early 1940's postponed the next census of manufactures until 1948 (for 1947). That census was again taken for 1954, 1958, 1963, and 1967.

Retail and wholesale trade data were first collected in 1930, and in 1933 information on selected service industries was added to the data-collection operation. These business censuses, as they were called, were again taken for 1935, 1939 (as part of the 1940 decennial program), 1948, 1954, 1958, 1963, and 1967.

Information on construction industries was first obtained in 1930 and again for 1935 and 1939. Data for the full spectrum of construction industries were not gathered again until 1968 (for 1967).

The need for transportation data to supplement information available from existing governmental or private sources was recognized by Congress in the late 1950's and early 1960's. The census of transportation (consisting of several surveys) was first taken for 1963 and again for 1967.

Since 1967, all of the above censuses have been taken quinquennially as part of the Census Bureau's economic census program. (For the 1977 censuses, the coverage of the service industries was broadened from "selected services" to all services, except religious organizations and private households. A total of 41 additional four-digit standard industrial classifications (SIC's) in 7 SIC major groups was added to the scope of the

census. While most of the industries included for the first time for 1977 were covered again for 1982, some were not, i.e., hospitals; elementary and secondary schools; colleges, universities, and professional schools; junior colleges and technical institutes; labor unions and similar labor organizations; and political organizations.)

The first manufacturing census for an outlying area was conducted in Puerto Rico for the year 1909. Thereafter, with the exception of 1929, a census was taken at 10-year intervals through 1949. The first censuses of retail trade, wholesale trade, and selected service industries in Puerto Rico were conducted for 1939. These censuses also were taken for the years 1949, 1954, 1958, 1963, and 1967. A census of construction industries was first introduced in Puerto Rico for 1967. These censuses of Puerto Rico have been taken since then for the years 1972, 1977, and 1982.

Censuses of manufactures, retail trade, wholesale trade, and selected service industries were conducted in Guam and the Virgin Islands of the United States for 1958, 1963, 1967, 1972, 1977, and 1982. Censuses of mineral industries were taken in the Virgin Islands of the United States for the years 1958, 1963, and 1967 but not since that time. A census of construction industries was also undertaken in these areas for 1972, 1977, and 1982.

Retail trade, wholesale trade, selected service industries, manufacturing, and construction industries were canvassed for the first time in the Northern Mariana Islands in 1983 (for 1982).

For 1982, the economic censuses and agriculture censuses were conducted concurrently.

USES OF THE ECONOMIC CENSUSES

The economic censuses are the major source for facts about the structure and functioning of the Nation's economy and provide essential information for government, business, industry, and the general public. They provide an important part of the framework for such composite measures as the gross national product, input-output measures, indexes of industrial production, and indexes measuring productivity and price levels. Information from the censuses is used to establish sampling frames and as benchmarks for current surveys of business activity, which are essential for measuring short-term economic conditions.

State and local governments use census data to assess business activities within their jurisdictions. The private sector uses the data to forecast general economic conditions; analyze sales performance; lay out sales territories; allocate funds for advertising; decide on locations for new plants, warehouses, or stores; and measure potential markets in terms of size, geographic areas, kinds of business, and kinds of products made or sold.

Following every census, thousands of businesses and other users purchase reports. Likewise, census facts are widely disseminated by trade associations, business journals, and newspapers. Volumes containing census statistics are available in most major public and college libraries. All 1982 data are

¹Standard Industrial Classification Manual: 1972. For sale by Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Stock No. 041-001-00066-6. 1977 Supplement. Stock No. 003-005-00176-0.

available on microfiche from the U.S. Government Printing Office and most data on computer tape from the Census Bureau. Finally, the more than 50 State Data Centers also are suppliers of economic census statistics.

AUTHORITY AND SCOPE OF THE ECONOMIC CENSUSES

The economic censuses are required by law under title 13 of the United States Code, sections 131, 191, and 224, which directs that they be taken at 5-year intervals for the years ending in 2 and 7. The 1982 Economic Censuses covered manufacturing, mining, construction industries, retail trade, wholesale trade, service industries, and selected transportation activities. Special programs also cover minority-owned and women-owned businesses. The next economic censuses are scheduled to be taken in 1988 for the year 1987.

CENSUS OF TRANSPORTATION

The 1982 Census of Transportation consists of three surveys:

- 1. Truck Inventory and Use (TIUS)
- 2. Selected Statistics for Transportation Industries²
- 3. Commodity Transportation³

These surveys were previously taken in 1967, 1972, and 1977.

TRUCK INVENTORY AND USE SURVEY

The Truck Inventory and Use Survey provides data on the physical and operational characteristics of the Nation's truck population. It is based on a probability sample of private and commercial trucks registered (or licensed) in the State during 1982.

Vehicles owned by Federal, State, and local governments, as well as ambulances, buses, and motor homes, were eliminated from the sample before questionnaires were mailed. Various other vehicles which were actually surveyed were subsequently classified as "out-of-scope": Trucks sold prior to 1982, farm tractors, unpowered trailer units, trucks reported to have been junked or wrecked prior to the registration year, etc.

Many States allow pickups and small vans and utility-type vehicles to be registered as cars or trucks; therefore, the passenger car files were searched and any such trucks were included in the sample universe. Some privately or commercially owned vehicles do not have to be licensed, such as "off-highway" trucks used exclusively on private property, and since they had no chance of being drawn in the sample, they are not covered in the survey.

TOTAL TRUCK INVENTORY

The estimated number of trucks that were within the scope of the TIUS and registered in the State as of July 1, 1982, was 239.4 thousand.

This estimate serves as the benchmark to which the survey results were adjusted to produce the more detailed estimates contained in this report. It was developed through a review of the characteristics of each vehicle registered in the State.

Prior to 1977, Truck Inventory and Use Surveys were benchmarked to Federal Highway Administration (FHWA) totals of private and commercial truck registrations as reported in Highway Statistics, table MV-1. These FHWA estimates are based on calendar year summary reports from the individual States that reflect differences in truck definitions used by the States for vehicle registration.

The FHWA estimate of the number of private and commercial trucks registered in the State as of December 31, 1982, was 263.3 thousand.

COMPARABILITY WITH PREVIOUS SURVEYS

Although the basic purpose and scope of the previous Truck Inventory and Use Surveys were essentially identical to this one, some changes were introduced in 1982 that may affect all the data in this report or just specific items.

1982 changes affecting all the data⁴:

- Stratification was based on body type rather than "small" vs. "large" trucks as in 1977. There were five strata: pickups; vans, panels and utilities; other single-unit trucks weighing less than 26,001 pounds; all other single-unit trucks; and truck tractors. See the section on sample design for an in-depth explanation of the stratification plan.
- 2. Two report forms were used: Form TC-9501 for pickups, panels, vans, and utility type vehicles if we could identify them specifically at the time of sampling. All other sampled vehicles received Form TC-9502. See appendix A for copies of the questionnaires. The difference in the two forms was that those questions which only pertained to heavy trucks were omitted from Form TC-9501.
- Calculation of the standard errors was changed to display relative standard errors in percent rather than the standard error in actual numbers.

1982 changes affecting specific items:

- Length of load space or capacity—Respondents were asked to report overall length of the vehicle instead of checking a box for load space or capacity.
- Axle arrangement of trailers—The pictures of trailer configurations were eliminated to remove any bias which they may have caused in 1977. For 1982, only descriptions of common number of axles for each trailer type were used.
- 3. What is the average weight of this vehicle as most often operated?—Respondents were asked to report average weight rather than maximum gross vehicle weight. Large trucks also were asked to report empty weight and maximum weight at which the vehicle operated.

² The Selected Statistics for Transportation Industries Program will include some data formerly shown in the Nonregulated Motor Carriers and Public Warehousing Report.

³The Commodity Transportation Survey will cover the data year 1983.

⁴ See report forms TC-9501 and TC-9502 reproduced in appendix A for specific information requested for each truck in sample.

- 4. Classification of operator—Because of the Motor Carrier Act of 1980, several changes were made to this item to allow for new types of for-hire operations. We added a category of "mixed" to both the not-for-hire and for-hire operations. In addition, respondents were asked to give the percent (%) of mileage when their operations were mixed or more than one type. The final operator classification was determined in the computer edit using the value corresponding to the highest mileage.
- Products carried—Instead of asking the respondents to select one specific type of product carried most of the time, we requested the percent of mileage for each product carried.

EXPLANATION OF TERMS

Vehicle size—This size classification is based on the gross vehicle weight (empty weight of the vehicle plus the average load carried) at which the vehicle operated during the past 12 months. The four size classes are:

- 1. Light—Gross vehicle weight of 10,000 pounds or less.
- Medium—Gross vehicle weight of 10,001 to 19,500 pounds.
- Light-heavy—Gross vehicle weight of 19,501 to 26,000 pounds.
- Heavy-heavy—Gross vehicle weight of 26,001 pounds or more.

Operator classification—This item consists of two major sections, never for hire and always for hire:

- 1. Never for hire—Includes a private owner or a company which transports its own materials or merchandise, or uses the vehicle for personal transportation.
- 2. Always for hire—Includes the following:
 - a. Interstate, exempt carrier—Includes those operators who are not required to have an I.C.C. certificate because they transport only exempt commodities or operate in an exempt zone.
 - b. Interstate, I.C.C. certified contract carrier—Includes those operators who carry the goods of someone other than the vehicle owner by individual contract or agreement.
 - c. Interstate, I.C.C. certified common carrier—Includes those operators who offer service to the general public, usually operating a regularly scheduled service between established terminals over a more or less regular route.
 - d. Intrastate, local cartage—Includes those operators who travel only within the state of registration or are engaged in local cartage.
 - e. Daily rental—Includes those operators who offer shortterm truck rental or leasing without a driver.

Major use—This item is based on the answer to the question: How was the vehicle mostly used during the past 12 months? Each of the 12 specific major use categories conforms to the generally accepted meaning of the terms. Responses to the "Other" category were recoded to one of the specific categories if possible. The following are frequent "Other" responses which were recoded:

- 1. House moving was recoded to "For-hire transportation."
- 2. Trucks used in conjunction with railroads were recoded to "For-hire transportation."
- 3. Armored car services were recoded to "Services."
- 4. Commercial fishing was recoded to "Agriculture."
- 5. Oilfield services were recoded to "Mining and quarrying."
- Certain specialized activities commonly thought of as services, such as plumbing, painting, plastering, carpentry, and electrical work, were recoded to "Construction."

U.S. mail service when done on a contract basis, antique trucks, and yard tractors were left in "Other."

The category "Not in Use" in the tables includes vehicles which, though licensed, were not used during the survey year, and those vehicles which were wrecked during the entire year.

Products carried—This item includes broad classifications of agricultural, manufacturing, and mineral products, as well as special categories of materials carried by trucks. Responses to the "Other" category were recoded to one of the 26 specific categories if possible. The following are frequent "Other" responses which were recoded:

- Crews of workers and their tools were recoded to "Craftsman's vehicle."
- Flowers, trees, shrubs, etc., were recoded to "Fresh farm products."
- Animal by-products and sewage were recoded to "Scrap, refuse, or garbage."
- 4. Clay was recoded to "Mining products."
- 5. Auto parts (including tires) were recoded to "Transportation equipment and parts."

Rental equipment, water, and personnel were among the major categories left in "Other."

Hazardous materials—This category was designed to identify those trucks which regularly transport hazardous materials in quantities large enough to require a placard under the Code of Federal Regulations, Title 49, Transportation.

Truck fleet size—The size of the truck fleet is based on the number of trucks operated by a truck owner from a single "base of operation." The fleet located at the "base of operation" usually is smaller than the total fleet that an owner has if he operates from more than one base. The data shown in the "Truck Fleet Size" section of the tables are based on the number of trucks found in fleets of specified size and not the number of fleets. (If the item of the survey form was unanswered, the vehicle was assumed to be in a fleet of one, classified in accordance with the reported vehicle type.)

Range of Operation—The area in which the vehicle usually operates is classified as one of the following:

1. Local—Mostly in the local area, i.e., in or around the city and suburbs, or usually within a 50-mile radius of the

farm, factory, mine, or other place where the vehicle is stationed.

- 2. Short range—Mostly over-the-road (beyond the local area), usually within a 50- to 200-mile radius from the place where the vehicle is stationed.
- Long range—Mostly over-the-road, usually more than 200
 miles one way to the most distant stop from the place
 where the vehicle is stationed.
- Off-the-road—Mostly off-the-road operation (usually associated with construction and farming).

Body type—This category includes the type of body that is either permanently attached to the power unit (i.e., straight truck) or most frequently used with a truck tractor as a tractor-trailer combination. Entries in the "Other" category were recoded if possible to a specific category. Those vehicles remaining in the "Other" category included truck tractors used in house moving, mobile home pulling, and boat transport.

Annual miles—Respondents were asked to report the total number of miles the truck was driven during the past 12 months. If the vehicle had less than 1 year's use, the respondent was asked to estimate the probable miles for a full year. If there was no response to the item, the annual miles were estimated (based on lifetime miles, length of time the vehicle was owned, body type, area of operation, vehicle type, and fuel type).

SAMPLE DESIGN

The Truck Inventory and Use Survey (at the national level) was based on a stratified probability sample of about 120,000 trucks drawn from an estimated universe of approximately 35 million current registrations on file with the motor vehicle departments in the 50 States and the District of Columbia.

A stratified random sample based on body type was selected in each State. Each State was divided into five strata: "pickup," "van," "single-unit light," "single-unit heavy" and "truck tractor." The "pickup" truck stratum consisted of only pickup trucks. The "van" truck statum consisted of panel trucks, vans, utilities, jeeps, and station wagons on truck chassis. The "single-unit light" truck stratum consisted of all other single-unit trucks with a gross vehicle weight (GVW) of 26,000 pounds or less. The "single-unit heavy" truck stratum consisted of the remaining single-unit trucks. The "truck tractor" stratum consisted of only truck tractors.

Part of the sample (two-thirds) was allocated to meet "minimum" standards of reliability for each stratum in each State. For the "pickup" stratum, a minimum sample size was determined for each State based on the percentage of pickups in that State (the pickup strata usually contains 40 to 75 percent of the trucks in a State). Larger minimum sample sizes were specified for States with a larger percentage of trucks in the "pickup" stratum to decrease the domination of the variances by the "pickup" stratum in these States. For the remaining strata, a constant minimum sample size in each State was set as follows: 60 trucks for the "van" stratum, 700 (except 400 in the District of Columbia) trucks for the "single-unit light" stratum, 250 (except 100 in District of Columbia) trucks for the "single-unit heavy" stratum, and 400 (except 250 in Alabama, Hawaii, Idaho, Maine, Montana, Nevada, New Hampshire, Minnesota, North Dakota, New York, Rhode Island, Vermont,

and 25 in the District of Columbia) trucks for the "truck tractor" stratum.

The rest of the sample was allocated to the strata proportionately to the number of trucks in the State to improve the U.S. estimates. The number of total trucks sampled in each State ranged from 1,462 for Rhode Island to 5,016 for California (except 658 for District of Columbia), the mean being 2,352 trucks per State.

SURVEY METHOD

Report form TC-9501 was mailed to owners of trucks in the pickups and vans strata while report form TC-9502 was mailed to owners of all other trucks selected for the 1982 TIUS sample. The owner was asked to respond only for the vehicle identified by license number in the Registration Information Section of the report form, whether or not he or she was still the owner. These data (make, model year, license number, vehicle identification number) were imprinted on the form using information from the State registration records. The information received on the returned questionnaires was data keyed and processed through an extensive computer edit. Reports which contained questionable responses were referred and corrected if necessary. Estimates of the number of trucks with each characteristic were obtained by expanding the sampled units to the State truck population level.

RELIABILITY OF ESTIMATES

There are two reasons why the estimates based on data from a sample will vary from the unknown population value: Sampling variability and nonsampling error. The accuracy of a survey result depends not only on the sampling variability and nonsampling errors measured, but also on the nonsampling errors not explicitly measured. The following is a description of the sampling variability and nonsampling errors associated with the estimates made from the sample selected for the 1982 TIUS.

Sampling variability—The particular sample selected in this survey is only one of a large number of similar samples of the same size which could have been selected using the same sample design. If all possible samples had been surveyed, under essentially the same conditions, an estimate of an unknown population characteristic or value could have been obtained from each. The different samples give rise to a whole range of estimates for the unknown population value. A statistical measure of the variability among these estimates is the standard deviation, which can be approximated from any one sample.

Sampling variability in these tables is given as the percent relative standard error of estimate (RSE). The RSE is the standard deviation divided by the estimate, and this is converted to percent RSE by multiplying by 100. Except for table 2, the RSE's (in percent) are given only for the top row of estimates and the left column of estimates. The procedure for approximating the RSE's (in percent) for the other estimates is covered in appendix B.

The estimate from a particular sample and the approximation of the standard deviation associated with the estimate can be used to construct interval estimates called confidence intervals. A confidence interval is an expression of how well an estimate from a particular sample represents an unknown population value. Associated with each interval is a percentage of confidence (most commonly 68, 90, or 95 percent), which is interpreted as follows. If, for each possible sample, an estimate of

an unknown population value and the approximate standard deviation were obtained, then:

- For approximately 68 percent of the possible samples, the interval from one standard deviation below to one standard deviation above the estimate would include the unknown population value. We call this a 68-percent confidence interval.
- For approximately 90 percent of the possible samples, the interval from 1.6 standard deviations below to 1.6 standard deviations above the estimate would include the unknown population value. We call this a 90-percent confidence interval.
- For approximately 95 percent of the possible samples, the interval from two standard deviations below to two standard deviations above the estimate would include the unknown population value. We call this a 95-percent confidence interval.

Example of a confidence interval calculation:

Assume the number of furniture vans in table 2 is given as 117.4 thousand trucks with a relative standard error of 6.1 percent. Then the standard deviation is:

 $117.4 \times .061 = 7.16$ thousand trucks

Now, an approximate 90 percent confidence interval (the estimate, plus or minus 1.6 standard deviations) is 117.4 plus or minus 11.5, or 105.9 to 128.9 thousand trucks.

Nonsampling errors—All surveys and censuses are subject to nonsampling errors. Nonsampling errors can be attributed to many sources—The inability to obtain responses from all cases in the sample, the inability or unwillingness on the part of respondents to provide correct information, imputation for item nonresponse, response errors and bias, misinterpretation of questions, mistakes in recording or keying data, errors of collection or processing, and coverage problems because of differing registration practices and implementation in some of the States.

Explicit measures of the effects of these nonsampling errors are not available. However, most of the important operational and response errors were detected and corrected through an automated data edit designed to review the data for reasonableness and consistency and an intensive telephone followup. Quality control techniques were used to verify that operating procedures were carried out as specified.

Nearly all types of nonsampling errors that affect this survey would also occur in a complete census. Since surveys are conducted on a smaller scale than censuses, nonsampling errors can be controlled more tightly. Relatively more funds and effort can be expended toward eliciting responses, detecting and correcting response errors, and reducing processing errors. As a result, survey results can often be more accurate than census results.

Ninety percent of the questionnaires were returned, with an item nonresponse rate of not more than one percent for most of the major questions. For most estimates in these tables, total nonresponse is handled by allocating the unreturned questionnaires in proportion to the responses. For most categories in the tables, the item nonresponse (respondents not answering the item on the questionnaires) is shown on a separate line. For example, respondents who did not indicate the major use of their truck(s) are included in the "not reported" category. The number given represents the number of trucks not allocated to a particular major use. Users should exercise caution in allocating these trucks to the major uses, since the characteristics of item nonrespondents may differ significantly from those of the respondents.

For some questions, a response was generated to complete a blank on the questionnaire. Engine characteristics and body characteristics were frequently determined through analysis of the vehicle identification number (VIN) and charts based on manufacturer's specifications. All missing annual miles data were imputed based on information available about the truck's lifetime miles, its age, its vehicle type, its number of axles, its engine type, its area of operation, and its major use. Any biases introduced by the imputation and correction procedures are thought to be small.

ABBREVIATIONS AND SYMBOLS

The following abbreviations and symbols are used in this publication:

- Represents zero.
- (NA) Not available.
- (S) Withheld because estimate did not meet publication standards on the basis of either the response rate, associated standard error, or a consistency review.
- (Z) Represents less than 50 trucks, or 500,000 miles, or .05 percent, as appropriate for the data column.
- RSE Relative standard error.

¹Vans similar to panel trucks are included in pickup, panel, multistop, or walk-in.
2Annual miles were imputed if not reported.
3For 1967 survey, data were presented for 'Less than 6,000 miles' (64.9 percent) and '6,000 to 9,999 miles' (16.0 percent).
4For 1967, data do not include panels and pickups.

6 7 8 9	Driving wheels 4-wheel drive 2-wheel drive Front-wheel drive	160.5 53.0 103.2 4.3	46.6 20.9 23.6 (S)	(S) (Z) (S) (Z)	(S) (S) (S) (Z)	11.8 3.4 7.3 (S)	(S) (S) (S) (Z)	(S) (S) (S) (Z)	4.5 (Z) 4.5 (Z)

NOTE: Because the sample is designed to measure the number of trucks and not all of the specific vehicular and operational characteristics of those trucks, some data cells may have high relative standard errors of estimate (RSEs). For North Dakota, 44.4 of the cells have RSEs greater than 10 percent, and 37.7 of the cells have RSEs greater than 25 percent.

¹When no response was obtained for annual miles data were imputed.
²Detail does not add to totals because items were not applicable or multiple responses were possible.
³When no response was obtained, one truck was imputed based on body type of sampled vehicle.
²Pickups, panels, and vans are not included.

Table 4. Trucks by Vehicle Size: 1982—Con.

[Thousands. Data relate to State of registration. Detail may not add to total because of rounding. For meaning of abbreviations and symbols, see introductory text]

Vehicular and operational			Vehic	le size		Relative standard error	
characteristics	Total	Light	Light Medium		Heavy-heavy	of estimate (percent) for total	
PICKUPS, PANELS, VANS, UTILITIES, AND STATION WAGONS							
Total Pickups Panels or vans Utilities Station wagons	165.2 140.9 9.9 9.0 5.4	165.0 140.7 9.9 9.0 5.4	(S) (S) (Z) (Z)	(X) (X) (X) (X) (X)	(X) (X) (X) (X) (X) (X)	.7 1.1 15.9 20.5 24.8	
Driving wheels	160.5 53.0 103.2 4.3	160.2 53.0 103.0 4.3	(S) (Z) (S) (Z)	(XX) (XX) (XX) (XX)	NO N	1.2 10.8 5.8 49.3	

NOTE: Because the sample is designed to measure the number of trucks and not all of the specific vehicular and operational characteristics of those trucks, some data cells may have high relative standard errors of estimate (RSEs). For North Dakota, 56.4 of the cells have RSEs greater than 10 percent, and 37.4 of the cells have RSEs greater than 25 percent.

¹When no response was obtained for annual miles, data were imputed.

²Detail does not add to totals because items were not applicable or multiple responses were possible.

³When no response was obtained, one truck was imputed based on body type of sampled vehicle.

⁴Pickups, panels, and vans are not included.

Table 5. Trucks by Annual Mileage Class: 1982—Con.

[Thousands. Data relate to State of registration. Detail may not add to total because of rounding. For meaning of abbreviations and symbols, see introductory text]

		Annual miles¹							Relative
Vehicular and operational characteristics	Total	Less than 5,000	5,000 to 9,999	10,000 to 19,999	20,000 to 29,999	30,000 to 49,999	50,000 to 74,999	75,000 or more	standard error of estimate (percent) for total
PICKUPS, PANELS, VANS, UTILITIES, AND STATION WAGONS									
Total Pickups Panels or vans Utilities Station wagons	165.2 140.9 9.9 9.0 5.4	51.9 47.1 2.3 1.5 (S)	47.1 37.9 3.0 4.5 1.7	55.5 46.2 4.1 2.6 2.7	6.6 6.6 (Z) (Z) (Z)	99099	<u> </u>		.7 1.1 15.9 20.5 24.8
Driving wheels	160.5 53.0 103.2 4.3	50.4 9.7 40.7 (Z)	44.9 17.7 24.0 (S)	54.6 20.9 33.7 (Z)	6.6 (S) (S) (Z)	(9) (9) (9) (9)	(S) (Z) (S) (Z)	(X) (X) (X) (X)	1.2 10.8 5.8 49.3

NOTE: Because the sample is designed to measure the number of trucks and not all of the specific vehicular and operational characteristics of those trucks, some data cells may have high relative standard errors of estimate (RSEs). For North Dakota, 64.9 of the cells have RSEs greater than 10 percent, and 50.6 of the cells have RSEs greater than 25 percent.

¹When no response was obtained for annual miles, data were imputed.

²Detail does not add to totals because items were not applicable or multiple responses were possible.

³When no response was obtained, one truck was imputed based on body type of sampled vehicle.

⁴Pickups, panels, and vans are not included.

Table 6. Trucks by Range of Operation: 1982—Con.

[Thousands. Data relate to State of registration. Detail may not add to total because of rounding. For meaning of abbreviations and symbols, see introductory text]

Vehicular and operational			*	Relative standard			
characteristics	Total	Local	Short-range	Long-range	Off-the-road	Not reported	error of estimate (percent) for total
PICKUPS, PANELS, VANS, UTILITIES, AND STATION WAGONS							
Total Pickups Panels or vans Utilities Station wagons	165.2 140.9 9.9 9.0 5.4	113.0 97.5 5.6 6.9 3.0	19.2 14.3 2.7 (S) (S)	4.3 (S) (S) (S) (S)	27.4 25.4 (S) (S) (S)	1.3 1.3 (Z) (Z) (Z)	.7 1.1 15.9 20.5 24.8
Driving wheels	160.5 53.0 103.2 4.3	110.3 42.0 65.1 (S)	17.9 5.0 13.0 (Z)	4.3 (S) 3.4 (Z)	26.7 5.2 20.4 (S)	1.2 (Z) 1.2 (Z)	1.2 10.8 5.8 49.3

NOTE: Because the sample is designed to measure the number of trucks and not all of the specific vehicular and operational characteristics of those trucks, some data cells may have high relative standard errors of estimate (RSEs). For North Dakota, 65.1 of the cells have RSEs greater than 10 percent, and 46.5 of the cells have RSEs greater than 25 percent.

¹When no response was obtained for annual miles, data were imputed.

²Detail does not add to totals because items were not applicable or multiple responses were possible.

³When no response was obtained, one truck was imputed based on body type of sampled vehicle.

⁴Pickups, panels, and vans are not included.

This page is intentionally blank.

NOTE: Because the sample is designed to measure the number of trucks and not all of the specific vehicular and operational characteristics of those trucks, some data cells may have high relative standard errors of estimate (RSEs). For North Dakota, 34.0 of the cells have RSEs greater than 10 percent, and 26.0 of the cells have RSEs greater than 25 percent.

¹When no response was obtained for annual miles, data were imputed.
²Detail does not add to totals because items were not applicable or multiple responses were possible.
³When no response was obtained, one truck was imputed based on body type of sampled vehicle.
⁴Pickups, panels, and vans are not included.

1982 CENSUS OF TRANSPORTATION

TRUCK INVENTORY AND USE SURVEY

same law your report to the Census Bureau is confidential. It may be seen only by	O.M.B. APPROVAL NO. 0607-0390: EXPIRES 12/84 In correspondence pertaining to this report, please refer to this Census File Number (CFN)						
sworn Census employees and may be used only for statistical purposes. The law late provides that copies retained in your files are immune from legal process. BUREAU OF THE CENSUS							
Please complete this 1201 East Tenth Street Jeffersonville, Indiana 47134							
DUE DATE: 15 days after receipt of form							
Important — Please read							
All questions on this form refer to the vehicle described below and its use during the past 12 months (or the last 12 months you operated it). If there are errors in the vehicle registration information, consult the instruction sheet before continuing with the questionnaire.							
ESTIMATES ARE ACCEPTABLE. Pleas	Please correct errors in name, address, and ZIP code. ENTER street and number if not shown.						
CENSUS USE							
REGISTRATION Make of vehicle Year of model State	INFORMATION License number Vehicle identification number (VIN)						
01 102 103 104	105						
Item 1 — Is this vehicle still in your possession?	Item 7a — What was the average weight of this vehicle as it						
tem 1 – is this vehicle still in your possession? 201 1 YES – Are you the – 202 Owner? 2 Lessee? With questionnaire	was most often operated? An estimate is acceptable.						
2 NO Please continue with this questionnaire, answering each item according to how you used the vehicle during the last 12 months you owned (or leased) it, Continue with items to and b.	b. How often was this vehicle carrying payloads that filled –						
a. When did you dispose of this vehicle? Month Year	Percent						
Enter ligures only	Less than half its maximum cargo size						
b. How did you dispose of this vehicle?	Less than half its maximum cargo weight %						
204 1 □ Sold it (or gave it away) 2 □ Junked or scrapped it	Item 8 — During the past year, did you attach any trailers to this vehicle?						
.a Returned to leasing company	304 1 ☐]YES — Continue with items 8a, b, and c below 2 ☐]NO — SKIP to item 9						
Item 2 — When did you obtain this vehicle? Month Year	Percent						
Enter figures only	a. What percent of the time did this vehicle pull a trailer?						
ttem 3 — How did you obtain this vehicle?	b. How many axles were on the trailer unit which you 307						
206 1 Purchased it new	attached most frequently to the vehicle?						
3 Leased or rented it from someone else Continue with Items 3a and b	c. What was the loaded weight of the trailer most often attached to the vehicle?						
a. How was this vehicle leased or rented? 207 1 #ithout a driver	An estimate is acceptable.						
2	Item 9 - What kind of fuel does this vehicle use? 321 1 Gasoline 4 Other - Specify fuel						
b. Was this a long-term lease or rental agreement (12 months or more)?	2 Diesel 3 Niquefied petroleum gas (LPG)						
208 1 YES - What type was it?	Item 10 – How many cylinders does this vehicle have?						
2 Financing (no maintenance) 3 Financing and full maintenance	322 1 4 cylinders 4 Other - Specify unit						
.e [_] Other .s [_] NO	2 6 cylinders 3 8 cylinders						
> Item 4 — Did you lease or rent out this vehicle to anyone else?	Item 11 - What is the size (displacement) of your engine? Binter cubic inches, cubic						
209 1 YES - Continue with items 4a and b 2 NO - SKIP to item 5	centimeters, or lifers, whichever is applicable. Cubic inches (CI) Cubic centimeters (CC) Liters (L)						
a. How was it leased or rented out?	323 September 197 September 19						
210 1 Without a driver	Item 12 — What is the horsepower rating of this Horsepower						
2	vehicle's engine?						
b. Was this a long-term lease or rental agreement (12 months or more)?							
211 1 YES - What type was it? 2 Financing (no maintenance)	Item 13 – What kind of transmission does this vehicle have?						
3 Financing and full maintenance 4 Other	2 Automatic						
s NO	Item 14 – Does this vehicle have any of the following? Mark (X) as many as apply.						
	329 05 Radial tires 12 🛄 4-wheel drive						
Item 5 — What is the body type of this vehicle?							
313 01 ∰ Pickup o2 ∭ Panel or compact van	os Power steering 13 Front-wheel drive 10 Air conditioning						
313 01 [] Pickup 02 [] Panel or compact van 24 [] Utility (For example: Bronco, Blazer, Jeep, CJ — 5, 7, etc.)	to Air conditioning Item 15 — Who performed the general maintenance and major overhauls on this vehicle?						
313 01 ∰ Pickup o2 ∭ Panel or compact van	to Air conditioning Item 15 — Who performed the general maintenance and major overhauls on this vehicle? Mark (X) as many as apply Major Maintenance Major Overhault

APPENDIX B.

Approximating Unpublished Relative Standard Errors

The relative standard errors (RSE's) are presented for only the row and column totals in tables 3 through 8. The relative standard errors of an individual table cell may be approximated by the following two-step procedure.

First calculate the standard deviation (SD) for the table cell:

$$SD(CLT) = \frac{RCT \times RSE(RCT)}{100} \sqrt{\frac{(CLT) (STT - CLT)}{(RCT) (STT - RCT)}}$$

where:

RCT = the number of trucks in the row (or column)

CLT = the number of trucks in the cell

STT = the number of trucks in the State

Now, the RSE in percent can be calculated as follows:

$$RSE(CLT) = \frac{100 \times SD(CLT)}{CLT}$$

Although either the row or column can be used, it is usually best to use the one with the fewest trucks.

Example—There are an estimated 5.5 thousand trucks in the cell for agricultural multistops or walk-ins, for which we want to approximate the RSE in percent. To approximate the RSE in percent for the agricultural multistop or walk-in cell, the following information must be extracted from the table: (1) 500.3 thousand trucks in the State, (2) 110.3 thousand trucks and an estimated RSE of 7.6 percent for the "Agriculture" column, and (3) 27.7 thousand trucks and an estimated RSE of 11.2 percent for the "Multistop or walk-in" row.

Since the row total of 27.7 thousand is less than the column total of 110.3 thousand, use the row figures to approximate the RSE in percent:

SD(5.5) =
$$\frac{27.7 \times 11.2}{100} \sqrt{\frac{5.5(500.3 - 5.5)}{27.7(500.3 - 27.7)}} = 1.4$$

RSE(5.5) = $\frac{100 \times 1.4}{5.5} = 25.5 \text{ percent}$

Some exceptions from this procedure will yield better approximations of the relative standard error in particular cells. Certain rows and columns in the tables are composed predominately of trucks, excluding pickups and vans ("large trucks"). Because of the sample design, one obtains a better approximation of the relative standard error of the estimate for a cell within a row (column) of "large trucks" by using the row (column) total even though the column (row) total might be smaller. When both totals consist of "large trucks," use the smaller of the row or column totals.

Columns of predominately "large trucks":

Table 4—Light-heavy and Heavy-heavy
Table 5—50,000 to 74,999 miles and 75,000 miles or more
Table 7—All except Single-unit 2 axle trucks

Rows of predominately "large trucks":

Body Type—All except Pickup, Panel truck or Van, and Multistop or Walk-in

Annual Miles—50,000 to 74,999 and 75,000 or more

Range of Operation—Long range (more than 200 miles)

Gross Weight—All from 19,501 pounds and over

Lease Characteristics—Leased with driver

Hazardous Materials Carried—All carrying hazardous materials

Miles per Gallon—Less than 5 and 5 to 6.9

Equipment Type, Braking System—Air

Truck Type and Axle Arrangement—All except Single-unit
2 axle trucks

Cab Type—All
